-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☐ Responsive to communication(s) filed on \_\_\_\_.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1-75 is/are pending in the application.
- 4a) Of the above claim(s) 11-23, 41, 44-48 and 61 is/are withdrawn from consideration.
- 5) ☒ Claim(s) 68-73 is/are allowed.
- 6) ☒ Claim(s) 1-10, 24-40, 42, 43, 49-60, 62-67, 74 and 75 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 30 December 1999 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.  
If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

## Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).  
\* See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).  
a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☒ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449) Paper No(s) 17.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). \_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_

## **DETAILED ACTION**

### **Non-Final Rejection**

Claims 1-10, 24-40, 42-43, 49-60, 62-75 are pending examination.

Applicants' traversal, the amendment to claims 1-2, 9-10, 24, 27, 41, 49 and 62-63, the addition of claims 67-75 in paper no. 18, and Exhibit A in paper no. 14 are acknowledged and considered.

This application contains claims 11-23, 41, 44-48, and 61 drawn to an invention non-elected with traverse in Paper No. 7 and withdrawn in paper no. 18. A complete reply to the final rejection must include cancellation of non-elected claims or other appropriate action (37 CFR 1.144) See MPEP § 821.01.

### ***Priority***

This application claims benefit of provisional 60/114,495 filed on 12/31/1998 is acknowledged. However, it is not apparent that Figure 1 (SEQ ID NO: 3) and Figure 2 (SEQ ID NO: 4) of application 09/475,704 are present in this provisional. Applicants are requested to distinctly point out if SEQ ID: 3 and SEQ ID NO: 4 claimed priority to this provisional.

### ***Drawings***

**NOTE:** In the next response, please submit a response to the PTO 498 because a PTO 498 was filed with the non-final rejection dated 9/13/01 and the applicants have not submitted proposed corrections or corrections to the drawings. If the reply to the Non-Final Rejection does not have a response to the 498, the response will be considered non-responsive. See 37 CFR 1.85(a).

**Claim Rejections - 35 USC § 112**

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 1-10, 24-43, 49-60, and 62-66 remain rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for 1) an expression cassette comprising a polynucleotide sequence encoding a Gag polypeptide, wherein the polynucleotide sequence encoding said Gag polypeptide is set forth in SEQ ID NOs: 1 or 2; 2) an expression cassette comprising a polynucleotide sequence encoding a Gag polypeptide, wherein the polynucleotide sequence encoding said Gag polypeptide is set forth in SEQ ID NOs: 3 or 4; 3) The expression cassette of 2, wherein said polynucleotide sequence further includes a polynucleotide sequence encoding an HIV protease polypeptide; 4) The expression cassette of 2, wherein said polynucleotide sequence further includes a polynucleotide sequence encoding an HIV protease polypeptide; 5) The expression cassette of 2, wherein said polynucleotide sequence further includes a polynucleotide sequence encoding an HIV polymerase polypeptide; 6) A composition for generating an immunological response in a mammal, comprising the expression cassette of 1; 7) A method for generating an immune response in a mammal, comprising intramuscularly administering of the expression cassette of 1 to said mammal, 8) A cell comprising the expression cassette of 1, wherein the polynucleotide sequence is operably linked to control elements compatible with expression in the cell, and does not reasonably provide enablement for the rest of the disclosure. The specification does not enable any person skilled in

Art Unit: 1635

the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention commensurate in scope with these claims.

The invention lies in the field of producing an immunogenic composition or vaccine using an expression cassette comprising an HIV Gag polypeptide set forth in SEQ ID NOs: 1-4.

The state of the art exemplified by Gurunathan et al. indicates that the goal of developing effective vaccines for a particular disease depends on several factors:

- 1) Identification of a conserved antigen capable of inducing protection is an outbred population.
- 2) Design vaccines that can induce an appropriate qualitative and quantitative immune response.
- 3) Some diseases require different types of immune responses for effective primary and memory immunity (*J Immunol*, Vol. 161(9), pg. 4563, November 1998).

In addition, major consideration for any gene transfer or any DNA therapy protocol involve issues that include:

- 1) The type of vector and amount of DNA constructs to be administered
- 2) The route and time course of administration, the sites of administration, the trafficking of the genetic material within cellular organelles, the rate of degradation of the DNA, the level of mRNA produced, the stability of the mRNA product, the amount and stability of the protein produced, and
- 3) What amount of the expressed proteins considered to be therapeutically effective for a DNA therapy method (Anderson et al., *Nature*, Vol. 392, pp. 25-30, April 1998).

In addition, all of these issues differ dramatically based on the specific vector used, the route of administration, the subject being treated, therapeutically effective amount of the DNA, and the disease being treated.

Anderson indicates that the state of the art before 1998, and teaches that gene therapy is a powerful new technology that still requires several years before it will make a noticeable impact on the treatment of disease, and that several major deficiencies still exist including poor delivery systems, both viral and non-viral, and poor gene expression after genes are delivered (pp. 25-30).

Anderson further teaches that the reason for the low efficiency of gene transfer and expression in a subject is that we still lack the basis understanding of how vectors should be constructed what regulatory sequences are appropriated for which cell types (page 30, column 1, last paragraph). Furthermore, Verma et al., *Nature*, Vol. 389, pages 239-242, 1997, indicates that factors including the nature of the diseases and/or disorders, the nature of a DNA and/or target tissue, and a delivery system and/or amounts of the DNA complexes employed in the delivery system that would generate a therapeutic effect *in vivo* must be considered for any gene therapy method to be successful (page 238, columns 1 and 2). Thus, in view of the state of the art, producing an immunogenic composition or vaccine using a replicant defective vector encoding a nucleotide sequence is considered unpredictable.

The application contemplates: 1) Expression assays for the synthetic coding region of Gag and Gag-protease expression cassettes; 2) In vivo immunogenicity of Gag expression cassettes using plasmid DNA carrying the synthetic Gag expression cassette; 3) DNA immunization of non-human primates by administering intradermally, mucosally, bilaterally, intramuscularly into the quadriceps using various doses of a synthetic Gag-containing plasmid; 4) In vitro expression of recombinant alphavirus vectors or plasmid containing the synthetic Gag expression cassette; 5) In vivo immunogenicity of recombinant Sindbis replicon vectors containing Gag expression cassettes in mice by using intramuscular and subcutaneous routes.

Art Unit: 1635

The disclosure further claims that these experiments will exhibit increased potency for induction of cytotoxic T-lymphocytes (CTL) response and humoral immune response by using the Gag expression cassette.

The as-filed specification provides sufficient guidance for one skilled in the art to make an immunogenic composition comprising an expression cassette comprising of SEQ ID NO: 1 or 2 and for one skilled in the art to use the expression cassettes comprising of either SEQ ID NOs: 1 or 2 in a method of producing an immune response in a mammal by using intramuscular administration.

However, the as-filed specification does not provide sufficient description or one skilled in the art to make and/or use a sequence having at least 90% identity to any of the sequences presented as SEQ ID NO: 1-4 other than the sequences themselves. The specification does not provide sufficient guidance for what amino acids of any of the sequences listed above may be changed while the Gag polypeptide activity is retained. In view of the state of the art describing the function of HIV-1 Gag proteins in the virus life cycle as exemplified by Freed (Applicants' IDS, BG-2), where Freed states that the role played by HIV-1 Gag proteins during the life cycle are numerous and complex, involving not assembly but also virion maturation after particle release and early post-entry steps in virus replication (BG-2, abstract). Also, since the relationship of the sequence of a peptide and its tertiary structure (e.g. its activity) are not well understood and are not predictable (Ngo et al. The Protein Folding Problem and Tertiary Structure Prediction, 1994, Merz et al (ed.), Birkhauser, Boston, MA, pp. 433 and 492-495), it would require an undue amount of

Art Unit: 1635

experimentation for one skilled in the art in view of the prior art to arrive at other sequences that have at least 90% sequence identity to the Gag polypeptide encoded by SEQ ID NOs: 1-4 and still possess HIV Gag polypeptide activity.

In addition, with respect claim 62 and 63, which encompasses a method of generating an immune response in a subject comprising the expression cassette of claim 1 further comprising administration of a polypeptide derived from an HIV. The as-filed specification provides sufficient guidance for one skilled in the art to make and/or use an HIV polypeptide or fragment thereof, however the as-filed specification fails to provide sufficient guidance for one skilled in the art to make and/or use a polypeptide derived from an HIV. The disclosure defines "derived" as a first polynucleotide sequence if it has the same or substantially the same base-pair sequence as a region of a second polypeptide, or if it displays sequence identity (page 20). The specification does not provide sufficient guidance because one skilled in the art would understand that the genus of polypeptides is enormous and a polypeptide with a specific functional identity (HIV polypeptide) can share percent identity (0.1%-99.9%) to other polypeptides with distinct functional identity. Furthermore, the art of record provided above teaches the unpredictability of predicting the tertiary structure of a polypeptide from the primary structure of the polypeptide (Ngo et al.). Thus, in view of the breadth of the claim and the art of record, it would take one skilled in the art an undue amount of experimentation to reasonably extrapolate from making and/or using an HIV polypeptide or fragment

Art Unit: 1635

thereof to a polypeptide derived from an HIV because a polypeptide derived from an HIV encompasses polypeptides other than an HIV polypeptide or fragment thereof.

Furthermore with respect to claims encompassing a method of immunization of a subject using an immunogenic composition comprising the expression cassette comprising an HIV Gag polypeptide encoded by a polynucleotide sequence set forth in SEQ ID NO: 1 or 2, the state of the state of the art for immunizing a subject against HIV and in view of the disclosure does not provide sufficient guidance for one skilled in the art to produce a therapeutically effective (partial and/or full protection and treatment) in a subject. The state of the art regarding HIV vaccines as exemplified by Nathanson et al. *The Journal of Infectious Disease*, Vol. 182, pp. 579-89, 2000) suggest that the formulation of an effective AIDS vaccine constitutes a daunting challenge for a number of reasons, including the following:

- 1) the ability of the virus to persist, to replicate in the face of a vigorous immune response and ultimately, to destroy the integrity of the immune system by an attack on CD4 helper T lymphocytes;
  - 2) the question of whether partial immunity will suffice to protect vaccines against eventual disease;
  - 3) the absence of a single clear-cut immune correlate of protection;
  - 4) the difficulty of inducing neutralizing antibodies;
  - 5) the necessity of defining and inducing CTL epitopes that are immunodominant for each of many different MHC class I haplotypes;
  - 6) the question of whether a vaccine formulated on a virus of a single clade will protect against infection with viruses of other clades;
  - 7) the question of whether an effective vaccine must induce mucosal immunity; and
  - 8) the difficulty of developing an attenuated virus strain is immunogenic (page 586).
- Furthermore, Nathanson states that 15 years have past since HIV-1 was isolated and yet the possibility of an AIDS vaccine still appears quite remote (page 579).

In view of the state of the art for producing an HIV vaccine, the as-filed specification does not provide sufficient guidance for one skilled in the art to use the expression cassettes

Art Unit: 1635

exhibiting the contemplated biological functions as sought in the disclosure (e.g. under conditions that are compatible with expression of said expression cassette) in a method of immunization of a subject. The disclosure does not address what amount of expression of the Gag polypeptide is required in a subject to produce a treatment (encompasses partial/complete protection) and/or prevention (total protection) in said subject. Furthermore, the application does not provide sufficient guidance for how one skilled in the art would circumvent the immunological response of subject for a sufficient time for the Gag polypeptide to be expressed at a sufficient amount to produce a therapeutic response in the subject. This is important because the modulation of the expression level is necessary for each polypeptide to elicit a desired immune response without modifying or shutting the down host cell function and causing negative effects similar to those of traditional vaccines (Azevedo et al., *Brazilian Journal of Medical and Biological Research*, Vol. 32, page 152, 1999). In addition, as-filed specification does not address the concern with repeated administration of an immunogenic vector since repeated administration would cause decrease expression of the desired Gag polypeptide. Also, it would take one skilled in the art an undue amount of experimentation to determine how to target a specific tissue, which requires that the vector avoids degradation in the blood stream and integrates into the desired targeted tissue or cells. In addition, the specification does not provide sufficient guidance for one skilled in the art to determine whether the translation product produced is similar to the native Gag polypeptide encoded by polynucleotide sequences set forth in SEQ ID NOs: 1-2 after the gene is transcribed from the expression cassette in a cell because sometimes proteins are often inactive or otherwise possess different properties from the native protein due to protein folding after expression in a subject's (e.g. mice, primate, human, etc.)

Art Unit: 1635

cells. If the polypeptide produced in the cells is different from the Gag polypeptide set forth in polynucleotides sequences SEQ ID NOs: 1-2 then the modified polypeptides might not function as indicated by the claimed embodiment (*e.g.* method of immunization of a subject using an immunogenic composition comprising a sequence having at least 90% sequence identity to either SEQ ID NOs: 1 or 2 into said subject under conditions that are compatible with expression of said expression cassette in said subject).

In addition, the state of the art and the specification do not provide sufficient guidance for claims encompassing stem cells or progenitor cell thereof comprising an expression cassette of claim 1. One skilled in the art and considered would understand that if the expression cassette is not stably integrated into the genome of the host cell *e.g.* lymphoid cell, it would not be present after several rounds of replication. Also, one skilled in the art would understand that the development of a successful strategy for long-term gene expression in stem cells is immense (Prince, *Pathology*, Vol. 30, pp. 340, 1998). Prince teaches "the difficulties in determining the conditions to optimize stem cells division and consequently transduction, the ability to recognize and quantify successful transduction into stem cell is problematic (page 340)." Thus, in view of the specification and state of the art, the specification does not provide sufficient guidance for one skilled in the art to make and use stem cells or progenitor with the expression cassette of claim 1.

Furthermore, the examples in the as-filed specification appear to be prophetic examples due to the wording of the each example (*e.g.* verbs are in present tense form). In view of the unpredictability of gene therapy and the doubts expressed in the art of record, one skilled in the art would not be able to reasonably correlate that the examples set forth in the as-filed

Art Unit: 1635

specification are working examples. In view of these factors (state of the art for gene therapy, skill in the art of producing and HIV vaccine, and prophetic examples) and the concerns listed above, it is not apparent to one skilled in the art how to reasonably extrapolate experiments comprising prophetic examples to any method of immunization of a subject comprising, an immunogenic composition comprising an expression cassette, comprising a polynucleotide sequence encoding a synthetic HIV Gag polypeptide set forth in SEQ ID NO: 1 or 2.

In addition to the doubts expressed in Anderson, Nathanson, and Verma, the state of art exemplified by McCluskie et al. (*Molecular Medicine*, 5, pp. 287-300, 1999) teach that "the realization that results in mice often do not predict the situation in humans has also led to a large number of DNA vaccine studies in non-human primates", that "IM injection of plasmid DNA vaccines, while highly immunogenic in mice...was found only to be relatively so in chimpanzees..., and especially not all in Aotus monkeys" and that "it is probably safe to say that any vaccine that works in a human will work in a mouse, but note necessarily vice-versa" (page 296, column 2, second and third paragraphs). In addition, McCluskie et al. teach that "although non-human primate models are frequently used for development and testing of human vaccines, it is not clear how predicative they will be in the case of DNA vaccines where efficacy, by virtue of the requirement first to transfect cells and express the antigen, relies on many factors other than immunological responses to the antigen" (page 297, column 1).

Thus, it is not apparent as how one skilled in the art reasonably extrapolates, without undue experimentation, from the scope of vertebrate to the full scope of the claimed invention that would generate a treatment (encompasses partial/complete protection) and/or prevention (total protection) in any subject against any subtype of HIV. Even if the specification

Art Unit: 1635

contemplated that a clear improvement using the synthetic expression cassettes in an immunogenic composition has been prophetically displayed in mice, it is not apparent as to how the prophetic examples are reasonably extrapolated to the full scope of the claimed invention, encompassing any host (*e.g.*, snake, bird, fish, mammal, etc.) particularly given that there is no vaccine generation evidence showing that the prophetic examples are a general phenomenon, and given the doubts expressed in the art of record.

With respect to vaccination methods encompassing routes of administration, *e.g.*, intranasally and intramuscular, the state of the art exemplified by McCluskie teaches that the route of delivery of the DNA vaccine can have an impact on the efficiency of transfection as well as the types and location of cells transfected, and thus potentially on the nature of the immune response (pg. 295). In addition, McCluskie teaches that many different routes have been shown to be effective for DNA delivery in mice; however, few studies have compared responses obtained with different routes using the same antigen-expressing DNA, dose, and immunization schedule. There have been even fewer studies to compare routes of administration in non-human primates (pg. 295).

In conclusion, the as-filed specification and claims coupled with the state of the art at the time the invention was made only provide sufficient guidance and/or evidence to reasonably enable the claimed invention 1-8, listed above. One would have to engage in a large quantity of experimentation in order to practice the claimed invention based on the application's disclosure, the unpredictability of gene therapy and developing effective HIV vaccines encompassing any subject including any mammal for a protective effect and/or treatment. In addition, the prophetic examples as provided in the specification do not reasonably extrapolate to the full scope of the

Art Unit: 1635

claimed invention given that there is no evidence that the prophetic examples are a general phenomenon.

Applicants traverse the rejection under 112 enablement for the following reason(s): claims 42-43, 49-60, and 62-66 are directed to a method for generating an immune response and none of these claims recite "vaccine composition" or "method of treating (or vaccination against" HIV, rather they are drawn to compositions and methods for generating an immune response in a mammal; As is well-known and described, for example on page 15 of the specification, the generation of an immunological response does not necessarily provide protection and/or therapy; Applicants are not required to establish whether these immunological responses are protective or therapeutic; Applicants direct the Examiner's attention to Example 4-7 and attached Exhibit A that demonstrates the claimed expression constructs induce an immune response in a mammal when made, administered and tested for immunogenicity following the teaching of the specification; The references cited are a far cry away from establishing that methods of immune response to the claimed expression cassettes are not enabled by Applicants specification. See pages 6-10.

In addition, applicants traverse the rejection under 112, enablement, with respect to percent identity because the use of available programs for calculating identity or similarity between sequences is fully disclosed in the specification (pages 19-22). See page 10.

Applicants' traversal is acknowledged and is found partially persuasive because as stated in the last office action and re-stated above, the claimed invention

Art Unit: 1635

for 1-8 listed above. However, applicants' traversal is not found persuasive for one skilled in the art to make and/or use the full scope of the claimed invention because in view of the unpredictability for one skilled in the art to make and/or use an expression cassettes comprising a nucleotide sequences having at least 90% sequence identity to the sequence presented in SEQ ID NOs: 1, 2, 3, or 4 and in view of the art of record concerning the unpredictability of making and/or using a method of immunization an expression cassettes comprising a nucleotide sequences having at least 90% sequence identity to the sequence presented in SEQ ID NOs: 1 or 2; and the lack of guidance provided by the as-filed specification, it would take one skilled in the art an undue amount of experimentation to make and/or use the full scope of the claimed invention.

First, with respect to the starting material set forth in claims 1-10 and 24-26, 41-43, the as-filed specification provides sufficient guidance for one skilled in the art to make and/or use the expression cassette comprising SEQ ID NO: 1, 2, 3, or 4. It is noted that computer programs available are considered conventional for one skilled in the art to calculate identity or similarity between sequences. However, the as-filed specification and the applicants' traversal do not provide sufficient guidance for one skilled in the art to make and/or use a sequence having at least 90% sequence identity to SEQ ID NO: 1, 2, 3, or 4 as the starting material, because they do not teach what amino acids or polynucleotides (e.g. epitopes) are considered essential to retain the Gag activity observed by SEQ ID NOs: 1-4 and to use a sequence with 90% sequence identity as the starting material in an expression cassette for generating an immune

Art Unit: 1635

response while observing an immune response observed when using an expression cassette comprising SEQ ID NOs: 1 or 2. More specifically, the as-filed specification and/or the applicants' traversal do not provide sufficient guidance and/or factual evidence for what amino acids of any of the sequence listed above may be changed while Gag polypeptide activity observed with SEQ ID NOs: 1, 2, 3, or 4 is retained. Since the relationship of the sequence of a peptide and its tertiary structure (*e.g.* its activity) are not well understood and are not predictable (Ngo et al. The Protein Folding Problem and Tertiary Structure Prediction, 1994, Merz et al (ed.), Birkhauser, Boston, MA, pp. 433 and 492-495), it would require an undue amount of experimentation for one skilled in the art to arrive at other sequences that have at least 90% sequence identity to the Gag polypeptide encoded by SEQ ID NOs: 1-4 and to make and/or use an expression comprising sequences that have at least 90% sequence identity to the Gag polypeptide set forth in claim 1 in a method of generating an immune response to HIV Gag polypeptide (SEQ ID NOs: 1 or 2).

Furthermore, in view of the applicants assertion that other sequences can be identified using available programs for calculating identity between sequences is not found persuasive because one skilled in the art would require a polynucleotide sequence (starting material) and the search of the prior art displays that there are no sequences with at least 90% sequence identity to SEQ ID NO: 1, 2, 3, or 4 and in view of the lack of guidance provided by the art of record, one skilled in the art would rely on the guidance provided by the as-filed specification. In view of the reasons set forth above, the disclosure does not provide sufficient for one skilled in the art to

Art Unit: 1635

make and/or use any polynucleotide with at least 90% sequence identity to SEQ ID

NO: 1, 2, 3, or 4.

Furthermore, with respect to the rejection for claims 62 and 63 under 112, enablement, the applicants' traversal is not applicable to the rejection and therefore, is not found persuasive.

In addition, with respect to the assertion that the claimed invention is only encompassing a method of generating an immune response and not a vaccine, the as-filed specification defines "nucleic acid immunization" as the introduction of a nucleic acid molecule encoding one or more selected antigens into a host cell, for the *in vivo* expression of an antigen, antigens, an epitope, or epitopes (page 23). However, the art of record defines immunization" as "the protection to an individuals who have been exposed to an infectious organism or to elicit protective immunity and immunologic memory so that a subsequent exposure to the pathogenic agent will elicit a heightened immune response with successful elimination of the pathogen" (Kuby, Immunology, 2<sup>nd</sup> ed, W.H. Freeman and Company, 1994, pages 470-471). Stedman's Medical Dictionary (Williams and Wilkins, 26<sup>th</sup> ed, 1995, page 853) further defines immunization as "the protection of susceptible individuals from communicable disease by administration of a living, suspension of killed organisms, or inactivated toxin". Thus, in view of the definition of the term "immunization" by the state of the art, one skilled in the art would reasonably determine that a method of immunization for *in vivo* expression encompasses a protection of a mammal from HIV Pol.

More specifically, one skilled in the art would look for the definition of the term in the specification and on page 16 the disclosure states, "The response may

Art Unit: 1635

serve to neutralize infectivity, and/or mediate antibody-complement, or antibody dependent cell cytotoxicity (ADCC) to provide protection to an immunized host as stated above" and on page 58 "it is readily apparent that the subject invention can be used to mount an immune response to a wide variety of antigens and hence to treat or prevent a HIV infection particularly Type C HIV infection". Therefore, a method of generating an immune response is well known to one skilled in the art, however, in view of the term "immunization" in the art record and the general definition provided by the as-filed specification (pages 16, 23, and 58), one skilled in the art would reasonable determine that the claims 1, 41, 49-60 read on a method of treatment or protecting a mammal against HIV.

The traversal and the as-filed specification do not provide any sufficient guidance and/or factual evidence to overcome the concerns set forth by the art of record for making an expression cassette comprising SEQ ID NO: 1, 2, 3, or 4 and using the cassette comprising SEQ ID NO: 1 or 2 in a method of immunization because of the reasons set forth in the enablement rejection. The traversal only asserts that the specification provides sufficient guidance for one skilled in the art to make and use the expression cassettes and that the applicants are not required to establish whether these immunological responses are protective or therapeutic. In view of the concerns cited above by the art of record for making and/or using a method of immunization of a subject and the lack of guidance provided by the specification, it would take one skilled in the art an undue amount of experimentation

Art Unit: 1635

to reasonably extrapolate from generating an immune response in a subject to a method of immunization in a subject.

In addition, with respect to making and/or using any cell comprising an expression cassette comprising SEQ ID NO: 1 or 2, the applicants' traversal and the as-filed specification do not provide sufficient guidance for a representative number of stem cells or progenitor cell thereof comprising an expression cassette of claim 1 because they do not address the concerns set forth in the 112 enablement rejection. One skilled in the art would understand that the development of a successful strategy for gene expression in stem cells is immense (Prince, *Pathology*, Vol. 30, pp. 340, 1998). Prince teaches "the difficulties in determining the conditions to optimize stem cells division and consequently transduction, the ability to recognize and quantify successful transduction into stem cell is problematic (page 340)." To further emphasize the unpredictability for using animal stem cells in a method for expression of a transgene set forth by Prince, the art displays pre and post-filing references showing the unpredictability of using animal stem cells; see Chu et al., *J. Mol. Med*, Vol. 76, 1998, pp. 184-92, Van Tendeloo et al., *Leukemia* 2001, Vol. 15, pp. 523-544; Richter et al., *Int. J. Hematol.* Vol. 73, 162-169, 2001; Romano et al., *Stem Cells*, Vol. 18, pp. 19-39, 2000; Halene et al. *Human Gene Therapy*, Vol. 11, pp. 1259-1267, 2000. Thus, in view of the specification and the state of the art, the as-filed specification and the applicants' traversal do not provide sufficient guidance for one skilled in the art to make and/or use stem cells or progenitor thereof comprising the expression cassette set forth in claim 37.

Art Unit: 1635

Furthermore, the traversal is not found persuasive with regard to a method of immunization in a subject, because it is not apparent as how one skilled in the art reasonably extrapolates, without undue experimentation, from the scope of mammal to the full scope of the claimed invention that would generate a treatment (encompasses partial/complete protection) and/or prevention (total protection) in any subject against any subtype of HIV. Even if the specification contemplated that a clear improvement using the synthetic expression cassettes in an immunogenic composition has been prophetically displayed in mice, it is not apparent as to how the prophetic examples are reasonably extrapolated to the full scope of the claimed invention, encompassing any host (*e.g.*, snake, bird, fish, monkey, human, etc.) particularly given that there is no immunization generation evidence showing that the prophetic examples are a general phenomenon, and given the doubts expressed in the art of record.

With respect to the traversal for claims rejected under 112 second. Applicants' traversal (see pages 11-12) is acknowledged and is found persuasive and the rejection for claims 1-2, 9-10, 24, 27, 42, 49, and 62-63 are withdrawn.

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter, which the applicant regards as his invention.

Claim 37 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 37 recites the limitation "the lymphoid cells". There is insufficient antecedent basis for this limitation in the claim. The claim (claim 36), which claim 37 depends on recites an antigen-presenting cell.

### ***Double Patenting***

The non-statutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper time-wise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a non-statutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1, 2, 4, 6, 67, 74-75 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 7, 8, and 16 of co-pending Application No. 09/899,575. Although the conflicting claims are not identical, they are not patentably distinct from each other because the claims of co-pending application '575 is drawn to an expression cassette comprising a polynucleotide comprising x contiguous nucleotides, wherein (i) the X contiguous nucleotides have at least 90% identity to Y contiguous nucleotides of SEQ ID NO: 51, 99, or 68 (claims 7, 8, 16, respectively). SEQ ID NO: 51 in claim 7 and SEQ ID NO: 99 in claim 8 are 100% identical to SEQ ID NO: 1 in the instant application. In addition, SEQ ID NO: 68 is 100% identical to SEQ ID NO: 2 of the instant application. Furthermore, claims 74 and 75 of the instant application '704 are obvious variants of claims 7, 8,

and 16 of co-pending application '575 because the only difference between claims 74-75 of the instant application and claims of co-pending application '575 is using the expression cassette in a composition for producing an immune response in a mammal and a method of using the composition. One of ordinary skill in the art would have concluded that the invention defined in the claims in the application '704 is an obvious variant of the invention defined in the claims of the co-pending application '575 because the only material required for the composition in order to generate an immune response in claim 75 is the expression cassette.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claims 68-73 are in condition for allowance because they are free of the prior art.

Other than claims 68-73, no other claim is in condition for allowance.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kay Pinkney whose telephone number is (703) 305-3553.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian Whiteman whose telephone number is (703) 305-0775. The examiner can normally be reached on Monday through Friday from 7:00 to 4:00 (Eastern Standard Time), with alternating Fridays off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's mentor, primary examiner, Dave Nguyen can be reached at (703) 305-2024.

If attempts to reach the primary examiner by telephone are unsuccessful, the examiner's supervisor, John L. LeGuyader, SPE - Art Unit 1635, can be reached at (703) 308-0447.
